TITLE: Poly(diorganophosphonyl)titanoxane oligomers

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 2, no. 11, 1966, 1913-1920

TOPIC TAGS: oligomer, organic chemical synthesis, titanium oxide, polymer stability

SUB CODE: 07

ABSTRACT: This report examines the synthesis and properties of compounds with the molecular chains Ti-O-Ti framed by different alkyl (aryl) phosphonyl groups. The basis of the synthesis of oligomers with titanoxane chains were reactions of hydrolytic polycondensation of bis(diorganophosphonyl)dibutyltitanates and reactions of replacement of butoxy-groups in polybutyltitanate with the residues of alkyl(aryl)phosphinic acids. The synthesis of the original titanophosphororganic compounds was accomplished through heating of ortho-butyltitanate with alkyl(aryl)phosphinic and

phosphoric acids, taken in 1:2 molar ratio at a temperature of 130-140°C. The titanophosphorganic compounds obtained are solid or resinlike products readily soluble in most organic solvents. Investigation of the stability of poly(diorganophosphonyl)titanoxane oligomers to the action of high temperatures in the presence of air oxygen established that thermooxidative destruction up to 450°C occurs chiefly in the direction of the oxidation of organic groups near the phosphorus atom framed by the titanoxane chain. No destruction at the Ti-O-P bond, and also at the Ti-O-Ti bond at this temperature is observed. Destruction of the Ti-O-Ti bond, that is the main chain of the molecule of poly(diorganophosphonyl)titanoxane upon heating oligomers to 800°C was not observed. TITLE: A Method of Determining Beryllium in Ores by Photoneu-  
trons (K metodike opredeleniya berilliya v rudakh po  
fotoneytronam)

PERIODICAL: Tr. Radiyev. in-ta AN SSSR, 1957, vol 5, Nr 2, pp 89-93

ABSTRACT: Neutron radiation, produced by bombarding beryllium-  
bearing material with gamma rays of sufficient energy,  
was used for bombarding the target. A comparison of the  
radioactivity of a standard with that of a sample intro-  
duced in the target makes it possible to calculate the  
concentration of Be in the sample. A vial containing  
48.5 mg of Ra-equivalent serves as the gamma-ray source.  
Silver is used for the target. Experimental studies  
have shown that for a given strength of gamma radiation  
the introduced radioactivity, within sufficiently wide

A Method of Determining Beryllium in Ores by Photoneutrons

limits, is proportional to the concentration of Be. For Be concentrations of 0.1%, the error of measurement amounts to several times 10%. For concentrations of 0.5%, the error is down to 10%. For large concentrations the error is lowered in proportion to the square root of the concentration.

TITLE: Polybis-(organophosphinoxy)-titanomethylphenylsiloxanes

SOURCE: Plasticheskiye massy, no. 3, 1966, 33-36

TOPIC TAGS: organosilicon compound, condensation reaction, thermal analysis, organotitanium compound

ABSTRACT: The author prepared linear polyorganotitaniumsiloxane with a regular distribution of Ti and Si atoms in their chains by a condensation of  $\alpha$ ,  $\omega$ -dihydroxymethylphenylsiloxane with bis(methylalkoxyphosphoxy)dibutoxytitanium and studied the influence of the bis(methylalkoxyphosphoxy)titanoxane groups on the properties of the polymers obtained. The bis(organophosphinoxy)dibutoxytitanium compounds were prepared by the reaction of the general scheme:

Card 1/4

UDC: 678.84

L 39717-66

ACC NR: AF6007968

Organophosphinic acid was added to tetrabutoxytitanium by drops, the mixture was mixed thoroughly and the products fractionally distilled. The reaction was exothermic. Thus obtained, bis(organophosphinoxy)dibutoxytitanium compounds were subjected to a condensation with  $\alpha, \omega$ -dihydroxymethylphenylsiloxane according to the general scheme:

The condensation was performed at 175-180°C, first in air, then in  $\text{N}_2$ , and finally in vacuo (1-2 mm). The following compounds were prepared having a Si/Ti ratio - 30, 50, 90, 120, and 200:

Card 2/4

L 39717-66

ACC NR. AP6007968

The properties of the polymers obtained were compared with those of polymethylphenylsiloxane. Their glass temperatures are in the more positive ranges (Fig. 1), and the endo- and exothermal peaks during thermodifferential analysis were at higher temperatures (Fig. 2). By heating at 400C for 4 hr in air, their weight losses were lower (Fig. 3). Orig. art. has: 4 fig. and 3 tables.

solution, 3.5. In analysis of the InP alloy, phosphorus was determined immediately after the determination of indium in the same solution, by the magnesia weight method. In the analysis of the InAs alloy, after determination of indium,  $AsO_4^{3-}$  was determined in the same solution by the iodometric method. In the analysis of the InP-InAs system,  $As^{5+}$  was reduced to  $As^{3+}$  according to the reaction:

thus paving the way for the subsequent determination of  $PO_4^{3-}$  in the presence of  $AsO_3^{3-}$ . The phosphorus content was determined after determination of the arsenic, by the magnesia method. All experimental results are shown in tabular form. Orig. art. has: 1 table.

and its monoisobutyl ester are titrated as monobasic acids. Upon addition of 0.2% H<sub>2</sub>O to methyl ethyl ketone, methylphosphonic acid begins to react and is titrated as a dibasic acid. The amount of added water is determined by titration with a solution of sodium hydroxide. The presence of thymolphthalein as an indicator reverse titration, based on the reaction of dimethylphosphoryl dichloride with an excess of a 0.1 N solution of piperidine in absolute methyl ethyl ketone. Titration of the excess piperidine with a 0.1 N solution of hydrochloric acid, was used to determine the acid dichloride. In addition to the quantitative determination of the phosphoric acid and derivatives, two-component mixtures (methylphosphonic acid, hydrochloric acid, and the acid ester) were analyzed in absolute methyl ethyl ketone medium by potentiometric titration with a 0.1 N solution of tetraethylammonium hydroxide, without the addition of water and with an addition of water. In the titration of two-component mixtures in absolute methyl ethyl ketone, two potential drops were observed. With the addition of water, three distinct potential drops were observed. The addition of 4-6% water to the beginning of the titration produced three distinct potential drops: 1) neutralization

Card 2/3

L 52330-65

ACCESSION NR: AP5015697

of HCl (quantitative results); 2) neutralization of the first stage of methylphosphinic acid (quantitative results); 3) neutralization of the second stage of methylphosphinic acid (unstable results). In the titration of the component mixtures, two potential drops were obtained in absorption of ethyl ketone, the first corresponding to the neutralization of hydrochloric acid, the second to the sum of the first stage of methylphosphinic acid and the acid ester, overestimated results being obtained according to the second drop. The addition of 4.5% water to the methyl ethyl ketone before titration produced three distinctly differentiated potential drops: quantitative titration of HCl, quantitative titration of the sum of the first stage of methylphosphinic acid and the acid ester, and the sum of the second stage of methylphosphinic acid (unstable results).

The art. has 2 formulas, 5 graphs, and 4 tables.

TITLE: Determination of alkyl phosphonic and phosphonothioic dichlorides, dialkyl-phosphinic and phosphinothioic chlorides

SOURCE: IVUZ. Khimiya i khimicheskaya tekhnologiya, v. 9, no. 2, 1966, 200-204

TOPIC TAGS: analytic chemistry, volumetric analysis, potentiometric titration, organic phosphorus compound, organic sulfur compound, organophosphorus compound

ABSTRACT: A titrimetric method has been developed for quantitative determination of alkyl-phosphonic and phosphonothioic dichlorides, dialkyl-phosphinic and phosphinothioic chlorides, of methylphosphonic acid and free hydrochloric acid in the above-listed chlorides. The method was based on the reactions of these chlorides or methylphosphonic acid with a measured excess of an amine (piperidine or cyclohexylamine) in an organic solvent. Back-titration, potentiometric or visual, of the excess amine with 0.1 N HCl determined the quantity of all the organophosphorus or S-containing organophosphorus chlorides studied and of methylphosphonic acid. The relative error of all determinations with piperidine did not exceed -2.4%. Direct potentio-

Utilization of iron by *Clostridium acetobutylicum* I. D.  
KOLCHINSKA. *Mikrobiol. Zhurn., Akad. Nauk Ukr. SSR*  
1979, 19, 11-7 (1979) Russian summary. *C. acetobutylicum*  
incorporated into the culture medium. *C. acetobutylicum*  
irreversibly assimilates isotopic Fe from the culture medium,  
such assimilation being greater with heat application. No  
reduction in the radioactivity of the culture medium was  
demonstrable during incubation and growth. The obligate  
anaerobe, *C. acetobutylicum*, assimilates less isotopic Fe from  
the medium than does the facultative anaerobe *E. coli*, and  
still less than aerobe *Sarcoma fava*. The latter has a greater  
physiol. affinity for  $Fe^{++}$  than for  $Fe^{+++}$ . I. S.

 Author : Kolchinskaya, I.D.  
 Inst :  
 Title : Effect of Iron on Metabolic Processes in Clostridium  
 Acetobutylicum.  
 Orig Pub : Mikrobiol. zh., 1957, 19, No 1, 3-16  
 Abstract : Addition of  $FeSO_4$  to a glucose medium and to rye medium  
 stimulates reproduction of Cl. acetobutylicum, increases  
 output of neutral products (acetone by 5%, butyl alcohol  
 by 7-11%) as well as gases, especially  $H_2$ ; output of  
 ethyl alcohol is decreased by 11%; the quantity of fer-  
 mented carbohydrates is increased. The oxidation-reduc-  
 tion potential of media containing Fe reaches a lower le-  
 vel during bacterial development than the media without Fe.  
 Using  $Fe^{59}$  it was established that cells of acetone-buty-  
 lic bacteria absorb inorganic Fe, but to a lesser degree

TITLE:

The Tarnishing of Polycaprolactam Direct in the Autoclave

PERIODICAL:

Khimicheskii volokna, 1959, Nr 6, pp 64-67 (USSR)

ABSTRACT:

The author discusses the disadvantages of the method of tarnishing polycaprolactam by spraying the ready polyamide resin with titanium dioxide. This method, which is used in the USSR, entails irregular distribution of  $TiO_2$  in the fibers (Fig 1), low efficiency of the mixing drums, repeated time-wasting processes of filling and emptying. He briefly mentions the fact that in other countries tarnishing of polyamide is carried out direct in special autoclaves. This method is not applicable in the USSR, because in that case the autoclaves would have to be reconstructed. Together with I. G. Shimko and K. Ye. Fishman, the author developed a method in which a 10 - 15% aqueous suspension of  $TiO_2$  is injected into the autoclave (Fig 2). Good evaporation of the water causes the mass to be well mixed and also warrants satisfactory

B004/B007

distribution of the  $TiO_2$  (Fig 3). The production of the suspension, testing its stability, and the influence exerted by surface-active substances and electrolytes on its stability are described. A table contains the specific weight of suspensions with different  $TiO_2$  content. Injection of the suspension is best carried out if the relative viscosity of the polyamide is 1.20 - 1.35 (Fig 4). Figure 5 shows the pressure- and temperature course of the autoclave process and the instant at which  $TiO_2$  is injected is given. Figure 6 (photo) shows an autoclave with injecting-device, which is being used in the author's plant. There are 6 figures and 1 table.

TITLE: Experience in programming an English-Russian machine translation algorithm  
on the Ural 4 digital computer

SOURCE: Nauchno-tekhnicheskaya informatsiya, no. 12, 1963, 45-48

TOPIC TAGS: machine translation, digital computer, computer programming

ABSTRACT: The programming of the Ural 4 digital computer with an algorithm for the translation of the U. S. patent weekly "Official Gazette" is described. The algorithm comprises a system of programs which take into account the most essential grammatical relationships. The system of programs uses the address method for retrieval of information from the dictionary by a key (a concise code of words which is the address of the information on the English word). The method of key search is also extended to terminological conversions. The programs take into account the

L 14024-66  
ACC NR: AP6003134

possibility of ambiguities in the keys and methods for eliminating them. A block of text is replaced by a block of information which is then processed by the grammatical analysis program. Russian equivalents are matched to the English words. The program for retrieval of Russian equivalents replaces the block of information with a block of Russian text in accordance with instructions stored in information cells. The alphanumeric printing program sends the Russian text of the patent to the printer in alphabetical form. An abstract containing an average of 300 words is translated and printed in about 65 seconds. A sample machine translation from the "Official Gazette", showing the original English and translated Russian texts, is appended to the article. At the time the article was written, the Division of Machine Translation and Search of Patent Literature at TsNIPI was working on the programming of an algorithm based on segmental analysis of the text which is simpler and has a higher capacity than the described algorithm and should also insure higher quality translation. Orig. art. has: 1 figure, 1 table.

PERIODICAL:

Izvestiya Akad. Nauk SSSR, Ser. Fiz. , 1957, Vol. 21, Nr 7, pp. 954 - 961 (USSR)

ABSTRACT:

1.) The intensities of the conversion lines. In the determination of the relative intensities of conversion lines the fact was taken into account that a portion of the atoms  $ThC'$  falls down from the source due to the  $\alpha$ -emission on the decay  $ThC' \xrightarrow{\alpha} ThC$ . This circumstance leads to the fact that the intensity of all conversion lines developing on the decay  $ThC' \xrightarrow{\beta} ThD$  decrease by 30 % in comparison with the intensity of the lines of other nuclei. Therefore the intensities of all lines which develop in connection with the decay  $ThC' \xrightarrow{\beta} ThD$  were determined with regard to the line L which develops in the same decay. The

intensities of the other lines were determined with regard to the I-line  $ThB \rightarrow ThC$ . In order to connect all intensities with each other the relation of the L- and I- line intensities to the source was determined, the latter being covered by a foil in order to prevent a falling down of the emission atoms. Detailed calculations and explanations are given. The authors estimate the accuracy of their measurements of the absolute intensities with 5 - 10 % for the intensive lines.

2.) The conversion spectrum in the domain  $H\beta$  - 1380 to 2600 Gs. cm

In the study of this portion of the spectrum 3 series of measurements were made. In every series the position and intensities of the lines were determined. The average values of  $H\beta$  and of the intensities are given in table 1, as well as the energy of the electrons and of the corresponding  $\gamma$ -transitions, the identification of the lines and comparative values of earlier works. It may be seen that the values obtained by the authors for  $H\beta$  and for the intensities differ markedly from earlier obtained values, where a photorecording of the electrons had been employed. Figures 1, 2, 3 and 4 represent some parts of the spectra of

TITLE:  $Tl^{208}$  Level Scheme (O skheme urovney  $Tl^{208}$ )

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya fizicheskaya, 1958,  
Vol. 22, Nr 7, pp. 785-787 (USSR)

ABSTRACT: In order to confirm and to define more precisely the spin values of the excited  $Tl^{208}$  levels, the relative intensities of  $\alpha$ -transitions were calculated under consideration of the carried off angular momentum. It is shown that the consideration of the angular momentum of the  $\alpha$ -particles substantially improves the consistency with experimental data. The calculated relative probabilities for  $\alpha$ -transitions to the 0,40 and 493 keV levels for which the spins have been uniquely determined are in remarkable agreement with the experiment. This allows to attribute spin values also to those levels that have not yet been determined. For the 328 and 473 keV levels the best agreement with experimental intensities of the  $\alpha$ -groups resulted from the 4 and 5 spin values, respectively. With these spin values, however, the missing

Card 1/2

Tl<sup>208</sup> Level Scheme

SOV/48-22-7-3/26

$\gamma$ -transition between the 493 and 328 keV levels is incomprehensible. One might expect that this transition must be of the M1 type and that a sufficiently strong line in the conversion spectrum would occur which, however, was not detected. The 328, 473, 493 and 619 keV levels are accounted for by the splitting of the configuration  $d_{3/2} g_{7/2}$ , which gives a quadruplet having the spin values  $3^+$ ,  $4^+$ ,  $5^+$ ,  $6^+$ . The spins  $3^+$  and  $6^+$  for the 493 and 619 keV levels are in agreement with such a configuration. However, the order of succession of the levels with spins  $4^+$  and  $5^+$  so far remains unexplained. There are 1 figure, 2 tables, and 12 references, 5 of which are Soviet.

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1958,  
Vol 35, Nr 2, pp 348-354 (USSR)

ABSTRACT:

As the experimental and theoretical values of conversion  
coefficients agree only very badly (Refs 1 - 10), the  
authors undertook the task of finding out to what extent the  
finite dimensions of nuclei influence these values. The  
present paper contains a report on the experimental  
investigations concerning this influence which is exercised  
on the relative conversion coefficients in L-subshells  
for pure M1-transitions. The following transitions were  
investigated:

and Yu. S. Yegorov

"Influence of the Finite Dimensions of the Nucleus on the Relative Conversion  
Coefficients in the L-Subshells\*  
Nuclear Physics, 9, No. 3, Jan. 1959, 498-508 (North Holland Publishing Co.,  
Amsterdam)

\*Paper read at the Eighth Annual Symposium on Nuclear Spectroscopy of the USSR  
Academy of Sciences, January 1958, Leningrad.

Abstract: Measurements have been made of the relative internal conversion  
coefficients in the L-subshells for three pure M1 transitions: 46.5 keV in  $\text{Bi}^{210}$ ,  
and 115.1 and 238.6 keV in  $\text{Bi}^{214}$ . It is shown that in order to obtain agreement  
with the experimental data, it is necessary to take into consideration the finite  
dimensions of the nucleus in the theoretical calculations of the L internal conversion  
coefficients.

Measurements have also been made of  $L_I$ ,  $L_{II}$ ,  $L_{III}$  for the 277.3 keV M1 transition  
in  $\text{Pb}^{208}$ .
